

IN THE ABSTRACT

Please replace the original Abstract with the following re-written Abstract.

-- An application specific integrated circuit has at least one standard cell, integrated circuit connection circuitry connected to the at least one standard cell and at least one programmable circuit that is connected or selectively connectable to the integrated circuit connection circuitry. The selected connection is made by metal mask changes if and when it is desirable to change the logic of the application specific circuit. The programmable circuit is a general-purpose logic block and may be reprogrammed to effect design changes.--

The Abstract and, *a fortiori*, any amendments to it, shall not be used in construing the scope of the claims. MPEP § 608.01(b).
